

ENVIRONMENTAL PERFORMANCE 2023

- The photovoltaic panels on the roofs of our two buildings, with a total installed capacity of 104.3 kWp, have generated 154,864 kWh this year. The installation of the photovoltaic station has resulted in a CO₂ savings of 98.86 tons in 2023.
- We have calculated the company's carbon footprint for Scope 1, 2 and 3 emissions for 2023 to identify ways to reduce it.
- We have two electric vehicles and one hybrid.
- One diesel forklift has been removed.
- Meetings have been held via Skype, Teams, and company WhatsApp, saving travel and therefore reducing emissions, resource consumption and time.
- LED lights have been installed throughout the rest of the company.
- We continue to use the 2x5 format in cardboard boxes to minimize the amount of plastic we put on the market.
- Comparing the carbon footprint of 2022 with that of 2023, we have reduced direct emissions but doubled indirect emissions due to increased commuting.
